HopcroftKarp.cpp

Description: Fast bipartite matching algorithm. Graph g should be a list of neighbors of the left partition, and $btoa$ should be a vector full of -1's of the same size as the right partition. Returns the size of the matching. $btoa[i]$ will be the match for vertex i on the right side, or -1 if it's not matched.

Usage: `vi btoa(m, -1); hopcroftKarp(g, btoa);`

Time: $\mathcal{O}\left(\sqrt{V}E\right)$

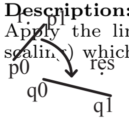
LinearTransformation.cpp

Description:
Apply the linear transformation (translation, rotation and scaling) which takes line p0-p1 to line q0-q1 to point r.



"Point.h" d41d8c, 6 lines

```
typedef Point<double> P;
P linearTransformation(const P& p0, const P& p1,
    const P& q0, const P& q1, const P& r) {
  P dp = p1-p0, dq = q1-q0, num(dp.cross(dq), dp.dot(dq));
  return q0 + P((r-p0).cross(num), (r-p0).dot(num))/dp.dist2
       ();
}
```

LineDistance.cpp

"Point.h" d41d8c, 7 lines

```
/*
Returns the signed distance between point p and the line
     containing points a and b. Positive value on left side
     and negative on right as seen from a towards b. a==b
     gives nan. P is supposed to be Point<T> or Point3D<T>
     where T is e.g. double or long long. It uses products in
      intermediate steps so watch out for overflow if using
     int or long long. Using Point3D will always give a non-
     negative distance. For Point3D, call .dist on the result
      of the cross product.
*/
template<class P>

QuickPhiSum.cpp

d41d8c, 29 lines

```
/*
This algorithm concerns efficient evaluation of sum of
     number theoric functions like phi or mu.
We know that using Eulerian sieve, we can only archieve O(n)
     time complexity.
What we are doing is to archieve O(n^{2/3}) time complexity.
The example program shows how to evaluate sum of phi and sum
     of mu efficientyl.
For smaller n (n less than (N^{2/3}), we use calculate them
     as usual.
For larger n, see getphi and getmu
*/

//See Sieve for more technical details.
//When i is prime, phi[i] = i-1;mu[i] = -1; Otherwise,
     inside the inner loop, let p = primes[j].
//Then it follows phi[p*i] = phi[i] * (p-1); mu[p*i] = -mu[i
     ];
//finally, when i % p == 0, phi[p*i] = phi[i]*p and mu[p*i]

SuffixTree.cpp

Description: Ukkonen's algorithm for online suffix tree construction. Each node contains indices [l, r) into the string, and a list of child nodes. Suffixes are given by traversals of this tree, joining [l, r) substrings. The root is 0 (has l = -1, r = 0), non-existent children are -1. To get a complete tree, append a dummy symbol – otherwise it may contain an incomplete path (still useful for substring matching, though).
Time: $\mathcal{O}(26N)$

d41d8c, 50 lines

Math Hints (2)

Newton's Method: $x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$.

Lagrange Multiplier: Let $f : \mathbb{R}^n \to \mathbb{R}$ be the objective function, $g : \mathbb{R}^n \to \mathbb{R}^c$ be the constraints function, let x^* be an optimal solution to the optimization problem such that $Dg(x^*) = c$: maximize $f(x)$ subject to $g(x) = 0$. There there exists λ such that $Df(x^*) = \lambda^* \top Dg(x^*)$.

Burnside's Lemma: Let G be a finite group acting on set X. Let X^g denote the set of elements in X that are fixed by g. Then the number of orbits is given by $|X/G| = \frac{1}{|G|}\sum_{g\in G}|X^g|$.

Linear Time Inverses Modulo p: For $i \geq 2$, $i^{-1} = -\lfloor \frac{p}{i} \rfloor (p \bmod i)^{-1}$.

Quadratic Residue: $\left(\frac{a}{p}\right) = a^{(p-1)/2}$. If $x^2 \equiv a (\text{mod} p)$ has a solution, then $\left(\frac{a}{p}\right) = 1$.

LGV Lemma: Assume $G = (V, E)$ is a DAG. Let $\omega(P)$ be the product of edge weights on path P. Let $e(u, v) := \sum_{P:u\to v} \omega(P)$ be the sum of $\omega(P)$ for all paths from u to v. The set of sources $A \subseteq V$ and set of sinks $B \subseteq V$. A collection of disjoint paths $A \to B$ consists of n paths S_i such that S_i is a path from A_i to $B_{\sigma(S)_i}$ such that for any $i \neq j$, S_i and S_j does not share a common vertex. Then if we let

$$M = \begin{bmatrix} e(A_1, B_1) & e(A_1, B_2) & \cdots e(A_1, B_n) & \\ \vdots & \vdots & \ddots & \vdots \\ e(A_n, B_1) & e(A_n, B_2) & \cdots & e(A_n, B_n) \end{bmatrix},$$

then $\det M = \sum_{S:A\to B} \text{sgn}\ \sigma(S) \prod_{i=1}^n \omega(S_i)$ where $S : A \to B$ denotes a set of disjoint paths S from A to B.

Network Flow with Lower/Upper Bounds: Suppose the flow must satisfy $b(u, v) \leq f(u, v) \leq c(u, v)$, and have conservation of flows over vertices.

Variant 1: No source/sink (i.e. flow at all vertices must be balanced), check if there is a feasible flow: create a graph G'. For any edge $u \to v$, add an edge with capacity $c(u, v) - b(u, v)$. Now assume initially, at vertex u, the sum of capacities of edges into u minus the sum of capacities out of u is M. If $M > 0$, add an edge from super source S to u with capacity M. If $M < 0$, add an edge from u to the super sink T with capacity $-M$.

Variant 2: Feasible flow with sources and sinks: Add an edge from original sink t to source s with capacity $+\infty$.

Variant 3: Maximum flow with sources and sinks: first, check if there exists a feasible flow. Then augment using source s and sink t (i.e. run Dinic again with source s and sink t).

Variant 4: Minimum flow with sources and sinks: find the feasible flow first, remove the edge from sink to source (the current flow on the edge is the size of the original flow), and then run the maximum flow from the sink t to the source s to see how much we may get rid off from the original flow.

Pick's Theorem: Suppose a polygon has integer coordinates for all of its vertices; let i be the number of integer points that are interior to the polyon, b be the number of integer points on its boundary, the area of the polygon is $A = i + \frac{b}{2} - 1$.

Mobius Transformation/Circle Inversion: Mobius transformations $f : \hat{\mathbb{C}} \to \hat{\mathbb{C}}$ are specified by $f(z) = \frac{az+b}{cz+d}$.

Dilworth's Theorem: For a partially ordered set S, the maximum size of an antichain is equal to the minimum number of chains (i.e. any two elements are comparable) required to cover S.

LP Duality: Suppose the primal linear program is given by maximize $\mathbf{c}^\top \mathbf{x}$ subject to $A\mathbf{x} \leq \mathbf{b}, \mathbf{x} \geq 0$, the dual progarm is given by minimize $\mathbf{b}^\top \mathbf{y}$ subject to $A^\top \mathbf{y} \geq \mathbf{c}, \mathbf{y} \geq 0$.

Mobius Inversion: If g, f are arithmetic functions satisfying $g(n) = \sum_{d|n} f(d)$ for $n \geq 1$, then $f(n) = \sum_{d|n} \mu(d) g(\frac{n}{d})$.

Number of Points on Lattice Convex Polygon: A convex lattice polygon with coordinates in $[0, N]$ has at most $O(N^{2/3})$ points.

Green's Theorem: Let C be a positively oriented, smooth, simple closed curve and let D be the region bounded by C. If L and M are functions of (x, y) defined on an open region containing D and having continuous partial derivatives, then

$$\int_C (Ldx + Mdy) = \int_D (\frac{\partial M}{\partial x} - \frac{\partial L}{\partial y}) dxdy.$$

Polynomial Division: Suppose we are given polynomials $f(x), g(x)$, and we want to write $f(x)$ as $f(x) = Q(x)g(x) + R(x)$. Let $f^R(x) = x^{\deg f} f(\frac{1}{x})$ (i.e. reverse the coefficients of the polynomial). Let $n = \deg f, m = \deg g$. Then

$$f^R(x) \equiv Q^R(x) g^R(x) \mod x^{n-m+1} /$$
